

Trauma stretcher

Since the purchase of the trauma stretcher by the Foundation of the Friends, this has brought us a lot of advantages for both the nursing staff and the patients. For nursing staff, the fact that the stretcher is electric means less physical effort to raise the stretcher to the correct height. The fact that there is an integrated scale, facilitates the administration of medication according to weight. For the medical imaging staff, brings improvement, because the fact that the stretcher has the space necessary to put the X-ray cassettes, it saves time, and also less physical effort because it eliminates the movement of the patient in the radiology department and having to move the patient on the procedure table, so less possibility of injury for the staff who are often only 1 per relay. Several benefits for the patient, the stretcher gives a wider space than the previous one for the comfort of the patient. The integrated weighing ensures that the patient receives the right amount of medication, because the weight is no longer just estimated, brings an optimal effect of the medication. The X-ray system integrated into the stretcher makes it possible to carry out the necessary examinations without moving the patient, therefore safer because the patient remains under surveillance in the emergency room, less painful for the patient, mobilization is reduced. And above all the patient is treated more quickly because less time to have the images and X-ray results.
